
Chiral Electro- and Photoactive Materials

Narcis Avarvari (narcis.avarvari@univ-angers.fr)

Laboratoire MOLTECH-Anjou, CNRS - Université d'Angers, France

Chirality manifests itself in many areas of physics, chemistry and biology, where objects or materials can exist in two non super-imposable forms, one being the mirror image of the other.¹ Introduction of chirality into conducting systems is a topic of much current interest as it allows the preparation of multifunctional materials in which the chirality might modulate the structural disorder or expresses its influence through the electrical magneto-chiral anisotropy effect.² The access to various chiral electroactive precursors for molecular conductors is therefore of paramount importance.³ Our endeavour towards chiral molecular superconductors will be outlined.⁴

In the same time, the most distinctive manifestation of chirality in chemistry is in the optical activity of chiral compounds, expressed as optical rotation or circular dichroism (CD). Additionally, when a chiral compound is emissive, circularly (CPL) can be expected to occur. Another chirality related effect is the chirality induced spin selectivity (CISS) consisting in a preferential spin transmission through a chiral material. We will show in this contribution different families of helicene based materials showing these two properties.^{5,6}
